Thanks for the concept Kevin. We are going to use a slightly different approach using SWAC vs Acre curves compared to cost in each SDU, but will have the same effect. We will share them with you once they are developed.

Here's the graph I scribbled on the flip chart today. It's a simplified depiction of site-wide residual risk reduction (and reliance on MNR) at construction completion for each major COC for each alternative. The percentages were calculated from the concentration reductions provided in Chap 4 with an understanding that a linear relationship exists for concentration, risk, and reliance on MNR. This would only be appropriate as a communication tool and not as a quantitative assessment.
